# Package 'cTMed'

March 22, 2024

**Title** Continuous Time Mediation

**Version** 0.0.0.9000

**Description** Calculates standard errors and confidence intervals
for the indirect effect in continuous time mediation models.

**URL** <https://github.com/jeksterslab/cTMed>,
<https://jeksterslab.github.io/cTMed/>

**BugReports** <https://github.com/jeksterslab/cTMed/issues>

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**Roxygen** list(markdown = TRUE)

**Depends** R (>= 3.5.0)

**LinkingTo** Rcpp, RcppArmadillo

**Imports** Rcpp, numDeriv, parallel

**Suggests** knitr, rmarkdown, testthat, simStateSpace, expm

**RoxygenNote** 7.3.1

**NeedsCompilation** yes

**Author** Ivan Jacob Agaloos Pesigan [aut, cre, cph]

confint.ctmeddelta          *Delta Method Confidence Intervals*

---

### Description

Delta Method Confidence Intervals

### Usage

```
## S3 method for class 'ctmeddelta'
confint(object, parm = NULL, level = 0.95, ...)
```

### Arguments

| | |
|---|---|
| object | Object of class `ctmeddelta`. |
| parm | a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered. |
| level | the confidence level required. |
| ... | additional arguments. |

### Value

Returns a matrix of confidence intervals.

**Author(s)**

Ivan Jacob Agaloos Pesigan

**Examples**

```
phi <- matrix(
  data = c(
    -0.357, 0.771, -0.450,
    0.0, -0.511, 0.729,
    0, 0, -0.693
  ),
  nrow = 3
)
colnames(phi) <- rownames(phi) <- c("x", "m", "y")

confint.ctmedmc                  *Monte Carlo Method Confidence Intervals*

---

### Description

Monte Carlo Method Confidence Intervals

### Usage

```
## S3 method for class 'ctmedmc'
confint(object, parm = NULL, level = 0.95, ...)
```

### Arguments

| | |
|---|---|
| object | Object of class ctmedmc. |
| parm | a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered. |
| level | the confidence level required. |
| ... | additional arguments. |

### Value

Returns a matrix of confidence intervals.

### Author(s)

Ivan Jacob Agaloos Pesigan

deboeck2015                   *Simulated Data Using Parameters from Deboeck and Preacher (2015)*

---

### Description

The data was simulated using `simStateSpace::SimSSMVARFixed()` from a discrete-time vector autoregressive model given by

### Usage

    deboeck2015

### Format

Dataframe with Five Columns:

**id** Individual ID.

**time** Time variable.

**x** X variable.

**m** M variable.

**y** Y variable.

### Details

$$\mathbf{y}_{i,t} = \boldsymbol{\beta}\mathbf{y}_{i,t-1} + \boldsymbol{\varepsilon}_{i,t}$$

where $\mathbf{y}_{i,t}$ and $\mathbf{y}_{i,t+1}$ represents a vector of observed variables $X$, $M$, and $Y$ for individual $i$ at time $t$ and $t-1$, $\boldsymbol{\varepsilon}_{i,t}$ a vector of normally distributed random noise with mean vector of zero and covariance matrix $\boldsymbol{\Psi}$ given by

$$\boldsymbol{\Psi} = \begin{pmatrix} 0.10 & 0 & 0 \\ 0 & 0.10 & 0 \\ 0 & 0 & 0.10 \end{pmatrix}, \quad \text{and}$$

$\boldsymbol{\beta}$ is a matrix of lagged parameters given by

$$\boldsymbol{\beta} = \left( \begin{array}{ccc} 0.70 & 0 & 0 \\ 0.50 & 0.60 & 0 \\ -0.10 & 0.40 & 0.50 \end{array} \right).$$

The mean vector $\boldsymbol{\mu}_0$ and covariance matrix $\boldsymbol{\Sigma}_0$ of the initial condition are given by

$$\boldsymbol{\mu}_0 = \left( \begin{array}{c} 0 \\ 0 \\ 0 \end{array} \right), \quad \text{and}$$

$$\boldsymbol{\Sigma}_0 = \left( \begin{array}{ccc} 1 & 0.20 & 0.20 \\ 0.20 & 1 & 0.20 \\ 0.20 & 0.20 & 1 \end{array} \right).$$

deboeck2015phi *Drift Matrix*

---

## Description

Parameter estimates and sampling variance-covariance matrix of the continuous-time vector autoregressive model drift matrix using the data set deboeck2015. The model was fitted using the dynr and ctsem packages.

## Usage

```
deboeck2015phi
```

## Format

List with Two Elements:

**dynr** Results using the dynr package.
**ctsem** Results using the ctsem package.

The dynr element is a list with the following elements:

**phi** The estimated drift matrix $\boldsymbol{\Phi}$.
**vcov** The estimated sampling variance-covariance matrix of $\text{vec}(\boldsymbol{\Phi})$.

The ctsem element is a list with the following elements:

**posterior** Posterior distribution.
**posterior_phi** Posterior distribution of the drift matrix $\boldsymbol{\Phi}$.
**phi** Posterior mean of the drift matrix $\boldsymbol{\Phi}$.
**vcov** Posterior variance-covariance matrix of $\text{vec}(\boldsymbol{\Phi})$.

|---|---|
| DeltaMed | *Delta Method Sampling Variance-Covariance Matrix for the Total, Direct, and Indirect Effects of X on Y Through M Over a Specific Time-Interval or a Range of Time-Intervals* |

---

## Description

This function computes the delta method sampling variance-covariance matrix for the total, direct, and indirect effects of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ over a specific time-interval $\Delta t$ or a range of time-intervals using the first-order stochastic differential equation model's drift matrix $\mathbf{\Phi}$.

## Usage

```
DeltaMed(phi, vcov_phi_vec, delta_t, from, to, med, ncores = NULL)
```

## Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\mathbf{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| vcov_phi_vec | Numeric matrix. The sampling variance-covariance matrix of $\mathrm{vec}\,(\mathbf{\Phi})$. |
| delta_t | Vector of positive numbers. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |
| ncores | Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when the length of delta_t is long. |

## Details

See `Total()`, `Direct()`, and `Indirect()` for more details.

**Delta Method:**

Let $\boldsymbol{\theta}$ be $\mathrm{vec}\left(\boldsymbol{\Phi}\right)$, that is, the elements of the $\boldsymbol{\Phi}$ matrix in vector form sorted column-wise. Let $\hat{\boldsymbol{\theta}}$ be $\mathrm{vec}\left(\hat{\boldsymbol{\Phi}}\right)$. By the multivariate central limit theory, the function $\mathbf{g}$ using $\hat{\boldsymbol{\theta}}$ as input can be expressed as:

$$\sqrt{n}\left(\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right) - \mathbf{g}\left(\boldsymbol{\theta}\right)\right) \xrightarrow{\mathrm{D}} \mathcal{N}\left(0, \mathbf{J}\boldsymbol{\Gamma}\mathbf{J}'\right)$$

where $\mathbf{J}$ is the matrix of first-order derivatives of the function $\mathbf{g}$ with respect to the elements of $\boldsymbol{\theta}$ and $\boldsymbol{\Gamma}$ is the asymptotic variance-covariance matrix of $\hat{\boldsymbol{\theta}}$.

From the former, we can derive the distribution of $\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right)$ as follows:

$$\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right) \approx \mathcal{N}\left(\mathbf{g}\left(\boldsymbol{\theta}\right), n^{-1}\mathbf{J}\boldsymbol{\Gamma}\mathbf{J}'\right)$$

The uncertainty associated with the estimator $\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right)$ is, therefore, given by $n^{-1}\mathbf{J}\boldsymbol{\Gamma}\mathbf{J}'$. When $\boldsymbol{\Gamma}$ is unknown, by substitution, we can use the estimated sampling variance-covariance matrix of $\hat{\boldsymbol{\theta}}$, that is, $\hat{\mathbb{V}}\left(\hat{\boldsymbol{\theta}}\right)$ for $n^{-1}\boldsymbol{\Gamma}$. Therefore, the sampling variance-covariance matrix of $\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right)$ is given by

$$\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right) \approx \mathcal{N}\left(\mathbf{g}\left(\boldsymbol{\theta}\right), \mathbf{J}\hat{\mathbb{V}}\left(\hat{\boldsymbol{\theta}}\right)\mathbf{J}'\right).$$

**Linear Stochastic Differential Equation Model:**

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \boldsymbol{\Lambda}\boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \boldsymbol{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\boldsymbol{\Lambda}$, and $\boldsymbol{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}}\mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

**Value**

Returns an object of class `ctmeddelta` which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used (DeltaMed).

**output** A list with length of `length(delta_t)`.

Each element in the `output` list has the following elements:

**delta_t** Time-interval.

**jacobian** Jacobian matrix.,

**est** Estimated total, direct, and indirect effects.,

**vcov** Sampling variance-covariance matrix of the estimated total, direct, and indirect effects.

Direct                          *Direct Effect of X on Y Over a Specific Time-Interval*

---

### Description

This function computes the direct effect of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ over a specific time-interval $\Delta t$ using the first-order stochastic differential equation model's drift matrix $\mathbf{\Phi}$.

### Usage

```
Direct(phi, delta_t, from, to, med)
```

### Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\mathbf{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| delta_t | Numeric. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |

### Details

The direct effect of the independent variable $X$ on the dependent variable $Y$ relative to some mediator variables $\mathbf{m}$ is given by

$$\mathrm{Direct}_{\Delta t_{i,j,\mathbf{m}}} = \exp\left(\Delta t \mathbf{D} \mathbf{\Phi} \mathbf{D}\right)_{i,j}$$

where $\mathbf{\Phi}$ denotes the drift matrix, $\mathbf{D}$ a diagonal matrix where the diagonal elements corresponding to mediator variables $\mathbf{m}$ are set to zero and the rest to one, $i$ the row index of $Y$ in $\mathbf{\Phi}$, $j$ the column index of $X$ in $\mathbf{\Phi}$, and $\Delta t$ the time-interval.

**Linear Stochastic Differential Equation Model:**

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \mathbf{\Lambda} \boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\mathbf{\Lambda}$, and $\mathbf{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and

$\varepsilon_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}} \mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

## Value

Returns an object of class `ctmedeffect` which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used ("Direct").

**output** The direct effect.

Indirect                      *Indirect Effect of X on Y Through M Over a Specific Time-Interval*

---

### Description

This function computes the indirect effect of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ over a specific time-interval $\Delta t$ using the first-order stochastic differential equation model's drift matrix $\Phi$.

### Usage

```
Indirect(phi, delta_t, from, to, med)
```

## Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\boldsymbol{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| delta_t | Numeric. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |

## Details

The indirect effect of the independent variable $X$ on the dependent variable $Y$ relative to some mediator variables $\mathbf{m}$ over a specific time-interval $\Delta t$ is given by

$$\mathrm{Indirect}_{\Delta t} = \exp\left(\Delta t \boldsymbol{\Phi}\right)_{i,j} - \exp\left(\Delta t \mathbf{D_m} \boldsymbol{\Phi} \mathbf{D_m}\right)_{i,j}$$

where $\boldsymbol{\Phi}$ denotes the drift matrix, $\mathbf{D_m}$ a matrix where the off diagonal elements are zeros and the diagonal elements are zero for the index/indices of mediator variables $\mathbf{m}$ and one otherwise, $i$ the row index of $Y$ in $\boldsymbol{\Phi}$, $j$ the column index of $X$ in $\boldsymbol{\Phi}$, and $\Delta t$ the time-interval.

### Linear Stochastic Differential Equation Model:

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \boldsymbol{\Lambda} \boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \boldsymbol{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\boldsymbol{\Lambda}$, and $\boldsymbol{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\varepsilon$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}} \mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi} \boldsymbol{\eta}_{i,t}\right) \mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}} \mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}W$ is a Wiener process or Brownian motion, which represents random fluctuations.

| MCMed | *Monte Carlo Sampling Distribution of Total, Direct, and Indirect Effects of X on Y Through M Over a Specific Time-Interval or a Range of Time-Intervals* |
|---|---|

## Description

This function generates a Monte Carlo method sampling distribution of the total, direct and indirect effects of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ at a particular time-interval $\Delta t$ using the first-order stochastic differential equation model drift matrix $\boldsymbol{\Phi}$.

## Usage

```
MCMed(
  phi,
  vcov_phi_vec,
  delta_t,
  from,
  to,
  med,
  R,
  test_phi = TRUE,
  ncores = NULL,
  seed = NULL
)
```

## Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\boldsymbol{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| vcov_phi_vec | Numeric matrix. The sampling variance-covariance matrix of $\mathrm{vec}\left(\boldsymbol{\Phi}\right)$. |
| delta_t | Numeric. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |
| R | Positive integer. Number of replications. |
| test_phi | Logical. If test_phi = TRUE, the function runs [TestPhi()](TestPhi()) on the generated drift matrix $\boldsymbol{\Phi}$. If the [TestPhi()](TestPhi()) returns FALSE, the function generates a new drift matrix $\boldsymbol{\Phi}$ and runs the test recursively until [TestPhi()](TestPhi()) returns TRUE. |

| ncores | Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of replications R is a large value. |
| seed | Random seed. |

### Details

See `Total()`, `Direct()`, and `Indirect()` for more details.

**Monte Carlo Method:**

Let $\boldsymbol{\theta}$ be $\mathrm{vec}\left(\boldsymbol{\Phi}\right)$, that is, the elements of the $\boldsymbol{\Phi}$ matrix in vector form sorted column-wise. Let $\hat{\boldsymbol{\theta}}$ be $\mathrm{vec}\left(\hat{\boldsymbol{\Phi}}\right)$. Based on the asymptotic properties of maximum likelihood estimators, we can assume that estimators are normally distributed around the population parameters.

$$\hat{\boldsymbol{\theta}} \sim \mathcal{N}\left(\boldsymbol{\theta}, \mathbb{V}\left(\hat{\boldsymbol{\theta}}\right)\right)$$

Using this distributional assumption, a sampling distribution of $\hat{\boldsymbol{\theta}}$ which we refer to as $\hat{\boldsymbol{\theta}}^{*}$ can be generated by replacing the population parameters with sample estimates, that is,

$$\hat{\boldsymbol{\theta}}^{*} \sim \mathcal{N}\left(\hat{\boldsymbol{\theta}}, \hat{\mathbb{V}}\left(\hat{\boldsymbol{\theta}}\right)\right).$$

Let $\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right)$ be a parameter that is a function of the estimated parameters. A sampling distribution of $\mathbf{g}\left(\hat{\boldsymbol{\theta}}\right)$, which we refer to as $\mathbf{g}\left(\hat{\boldsymbol{\theta}}^{*}\right)$, can be generated by using the simulated estimates to calculate $\mathbf{g}$. The standard deviations of the simulated estimates are the standard errors. Percentiles corresponding to $100\left(1-\alpha\right)\%$ are the confidence intervals.

**Linear Stochastic Differential Equation Model:**

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \boldsymbol{\Lambda}\boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \boldsymbol{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\boldsymbol{\Lambda}$, and $\boldsymbol{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}}\mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

## Value

Returns an object of class `ctmedmc` which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used (MCMed).

**output** A list with length of `length(delta_t)`.

Each element in the `output` list has the following elements:

**est** A vector of total, direct, and indirect effects.

**thetahatstar** A matrix of Monte Carlo total, direct, and indirect effects.

MCPhi                                    *Generate Random Drift Matrices Using the Monte Carlo Method*

---

### Description

This function generates random drift matrices $\mathbf{\Phi}$ using the Monte Carlo method.

### Usage

```
MCPhi(phi, vcov_phi_vec, R, test_phi = TRUE, ncores = NULL, seed = NULL)
```

### Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\mathbf{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| vcov_phi_vec | Numeric matrix. The sampling variance-covariance matrix of $\mathrm{vec}\left(\mathbf{\Phi}\right)$. |
| R | Positive integer. Number of replications. |
| test_phi | Logical. If test_phi = TRUE, the function runs [TestPhi()](#) on the generated drift matrix $\mathbf{\Phi}$. If the [TestPhi()](#) returns FALSE, the function generates a new drift matrix $\mathbf{\Phi}$ and runs the test recursively until [TestPhi()](#) returns TRUE. |
| ncores | Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of replications R is a large value. |
| seed | Random seed. |

### Details

**Monte Carlo Method:**

Let $\boldsymbol{\theta}$ be $\mathrm{vec}\left(\mathbf{\Phi}\right)$, that is, the elements of the $\mathbf{\Phi}$ matrix in vector form sorted column-wise. Let $\hat{\boldsymbol{\theta}}$ be $\mathrm{vec}\left(\hat{\mathbf{\Phi}}\right)$. Based on the asymptotic properties of maximum likelihood estimators, we can assume that estimators are normally distributed around the population parameters.

$$\hat{\boldsymbol{\theta}} \sim \mathcal{N}\left(\boldsymbol{\theta}, \mathbb{V}\left(\hat{\boldsymbol{\theta}}\right)\right)$$

Using this distributional assumption, a sampling distribution of $\hat{\boldsymbol{\theta}}$ which we refer to as $\hat{\boldsymbol{\theta}}^{*}$ can be generated by replacing the population parameters with sample estimates, that is,

$$\hat{\boldsymbol{\theta}}^{*} \sim \mathcal{N}\left(\hat{\boldsymbol{\theta}}, \hat{\mathbb{V}}\left(\hat{\boldsymbol{\theta}}\right)\right).$$

**Linear Stochastic Differential Equation Model:**

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \boldsymbol{\Lambda}\boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \boldsymbol{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\boldsymbol{\Lambda}$, and $\boldsymbol{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}}\mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

### Value

Returns a list of simulated drift matrices.

| Med | *Total, Direct, and Indirect Effects of X on Y Through M Over a Specific Time-Interval or a Range of Time-Intervals* |
|---|---|

### Description

This function computes the total, direct, and indirect effects of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ over a specific time-interval $\Delta t$ or a range of time-intervals using the first-order stochastic differential equation model's drift matrix $\boldsymbol{\Phi}$.

### Usage

```
Med(phi, delta_t, from, to, med)
```

### Arguments

| | |
|---|---|
| phi | Numeric matrix. The drift matrix ($\boldsymbol{\Phi}$). phi should have row and column names pertaining to the variables in the system. |
| delta_t | Vector of positive numbers. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |

## Details

See `Total()`, `Direct()`, and `Indirect()` for more details.

### Linear Stochastic Differential Equation Model:

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \boldsymbol{\Lambda}\boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \boldsymbol{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\boldsymbol{\Lambda}$, and $\boldsymbol{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\boldsymbol{\Lambda}$ a matrix of factor loadings, and $\boldsymbol{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \boldsymbol{\Theta}^{\frac{1}{2}}\mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)\left(\boldsymbol{\Theta}^{\frac{1}{2}}\right)' = \boldsymbol{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \boldsymbol{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \boldsymbol{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\boldsymbol{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\boldsymbol{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

## Value

Returns an object of class `ctmedmed` which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used (Med).

**output** A matrix of total, direct, and indirect effects.

---

| PosteriorMed | *Posterior Distribution of Total, Direct, and Indirect Effects of X on Y Through M Over a Specific Time-Interval* |
|---|---|

---

## Description

This function generates a posterior distribution of the total, direct and indirect effects of the independent variable $X$ on the dependent variable $Y$ through mediator variables $\mathbf{m}$ at a particular time-interval $\Delta t$ using the posterior distribution of the first-order stochastic differential equation model drift matrix $\mathbf{\Phi}$.

## Usage

```
PosteriorMed(phi, delta_t, from, to, med, ncores = NULL)
```

## Arguments

| | |
|---|---|
| phi | List of numeric matrices. Each element of the list is a sample from the posterior distribution of the drift matrix ($\Phi$). Each matrix should have row and column names pertaining to the variables in the system. |
| delta_t | Numeric. Time interval ($\Delta t$). |
| from | Character string. Name of the independent variable $X$ in phi. |
| to | Character string. Name of the dependent variable $Y$ in phi. |
| med | Character vector. Name/s of the mediator variable/s in phi. |
| ncores | Positive integer. Number of cores to use. If ncores = NULL, use a single core. Consider using multiple cores when number of replications R is a large value. |

## Details

See `Total()`, `Direct()`, and `Indirect()` for more details.

## Value

Returns an object of class ctmedmc which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used (PosteriorMed).

**output** A list with length of `length(delta_t)`.

Each element in the `output` list has the following elements:

**est** Mean of the posterior distribution of the total, direct, and indirect effects.

**thetahatstar** Posterior distribution of the total, direct, and indirect effects.

---

print.ctmedeffect          *Print Method for Object of Class* ctmedeffect

---

### Description

Print Method for Object of Class ctmedeffect

## Usage

```
## S3 method for class 'ctmedeffect'
print(x, digits = 4, ...)
```

## Arguments

| | |
|---|---|
| x | an object of class ctmedeffect. |
| digits | Integer indicating the number of decimal places to display. |
| ... | further arguments. |

## Value

Returns the effects.

## Author(s)

Ivan Jacob Agaloos Pesigan

## Examples

```
phi <- matrix(
  data = c(
    -0.357, 0.771, -0.450,
    0.0, -0.511, 0.729,
    0, 0, -0.693
  ),
  nrow = 3
)
colnames(phi) <- rownames(phi) <- c("x", "m", "y")
delta_t <- 1

# Time-Interval of One -----------------------------------------------

## Total Effect ------------------------------------------------------
total_dt <- Total(
  phi = phi,
  delta_t = delta_t
)
print(total_dt)

## Direct Effect -----------------------------------------------------
direct_dt <- Direct(
  phi = phi,
  delta_t = delta_t,
  from = "x",
  to = "y",
  med = "m"
)
print(direct_dt)

## Indirect Effect ---------------------------------------------------
```

```
indirect_dt <- Indirect(
  phi = phi,
  delta_t = delta_t,
  from = "x",
  to = "y",
  med = "m"
)
print(indirect_dt)
```

---

print.ctmedmc *Print Method for Object of Class* ctmedmc

---

### Description

Print Method for Object of Class ctmedmc

### Usage

```
## S3 method for class 'ctmedmc'
print(x, alpha = 0.05, digits = 4, ...)
```

### Arguments

| | |
|---|---|
| x | an object of class ctmedmc. |
| alpha | Numeric vector. Significance level $\alpha$. |
| digits | Integer indicating the number of decimal places to display. |
| ... | further arguments. |

### Value

Returns a matrix of estimates, standard errors, number of Monte Carlo replications, and confidence intervals.

### Author(s)

Ivan Jacob Agaloos Pesigan

### Examples

```
phi <- matrix(
  data = c(
    -0.357, 0.771, -0.450,

---

## Description

Experience Sampling Data (n = 1) used as Empirical Example in Ryan and Hamaker (2021)

## Usage

```
ryan2021
```

## Format

The data set has the following variables:

**id** ID

**time** Time variable

**s** Self-doubt

**f** Fatigue

**i** Irritable

**r** Restless

  to = "y",
  med = "m"
)
summary(med)
```

---

TestPhi                          *Test the Drift Matrix*

---

### Description

Both have to be true for the function to return TRUE.

- Test that the real part of all eigenvalues of $\Phi$ is less than zero.
- Test that the diagonal values of $\Phi$ are between 0 to negative inifinity.

### Usage

```
TestPhi(phi)
```

### Arguments

phi                 Numeric matrix. The drift matrix ($\Phi$).

```

```
TestPhi(phi = phi)
```

---

TestStable                          *Test Stability*

---

### Description

The function computes the eigenvalues of the input matrix x. It checks if the real part of all eigenvalues is negative. If all eigenvalues have negative real parts, the system is considered stable.

### Usage

```
TestStable(x)
```

### Arguments

x                          Numeric matrix.

Total                          *Total Effect Matrix Over a Specific Time-Interval*

---

### Description

This function computes the total effects matrix over a specific time-interval $\Delta t$ using the first-order stochastic differential equation model's drift matrix $\mathbf{\Phi}$.

### Usage

```
Total(phi, delta_t)
```

### Arguments

phi              Numeric matrix. The drift matrix ($\mathbf{\Phi}$). phi should have row and column names pertaining to the variables in the system.

delta_t          Numeric. Time interval ($\Delta t$).

### Details

The total effect matrix over a specific time-interval $\Delta t$ is given by

$$\text{Total}_{\Delta t} = \exp\left(\Delta t \mathbf{\Phi}\right)$$

where $\mathbf{\Phi}$ denotes the drift matrix, and $\Delta t$ the time-interval.

**Linear Stochastic Differential Equation Model:**

The measurement model is given by

$$\mathbf{y}_{i,t} = \boldsymbol{\nu} + \mathbf{\Lambda}\boldsymbol{\eta}_{i,t} + \boldsymbol{\varepsilon}_{i,t}, \quad \text{with} \quad \boldsymbol{\varepsilon}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{\Theta}\right)$$

where $\mathbf{y}_{i,t}$, $\boldsymbol{\eta}_{i,t}$, and $\boldsymbol{\varepsilon}_{i,t}$ are random variables and $\boldsymbol{\nu}$, $\mathbf{\Lambda}$, and $\mathbf{\Theta}$ are model parameters. $\mathbf{y}_{i,t}$ represents a vector of observed random variables, $\boldsymbol{\eta}_{i,t}$ a vector of latent random variables, and $\boldsymbol{\varepsilon}_{i,t}$ a vector of random measurement errors, at time $t$ and individual $i$. $\boldsymbol{\nu}$ denotes a vector of intercepts, $\mathbf{\Lambda}$ a matrix of factor loadings, and $\mathbf{\Theta}$ the covariance matrix of $\boldsymbol{\varepsilon}$.

An alternative representation of the measurement error is given by

$$\boldsymbol{\varepsilon}_{i,t} = \mathbf{\Theta}^{\frac{1}{2}}\mathbf{z}_{i,t}, \quad \text{with} \quad \mathbf{z}_{i,t} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{I}\right)$$

where $\mathbf{z}_{i,t}$ is a vector of independent standard normal random variables and $\left(\mathbf{\Theta}^{\frac{1}{2}}\right)\left(\mathbf{\Theta}^{\frac{1}{2}}\right)' = \mathbf{\Theta}$.

The dynamic structure is given by

$$\mathrm{d}\boldsymbol{\eta}_{i,t} = \left(\boldsymbol{\iota} + \mathbf{\Phi}\boldsymbol{\eta}_{i,t}\right)\mathrm{d}t + \mathbf{\Sigma}^{\frac{1}{2}}\mathrm{d}\mathbf{W}_{i,t}$$

where $\boldsymbol{\iota}$ is a term which is unobserved and constant over time, $\mathbf{\Phi}$ is the drift matrix which represents the rate of change of the solution in the absence of any random fluctuations, $\mathbf{\Sigma}$ is the matrix of volatility or randomness in the process, and $\mathrm{d}\boldsymbol{W}$ is a Wiener process or Brownian motion, which represents random fluctuations.

**Value**

Returns an object of class ctmedeffect which is a list with the following elements:

**call** Function call.

**args** Function arguments.

**fun** Function used ("Total").

**output** The matrix of total effects.
